                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for assaying an analyte in a sample comprising; contacting the sample with a mutant analyte-binding enzyme which has binding affinity for the analyte or an immediate analyte enzymetric conversion product but has attenuated catalytic activity; and detecting resulting binding. The method is useful in monitoring biological systems/processes, or prognosis/diagnosis of disease caused by imbalances of the analytes. The present sequence is a coding sequence used in the present invention.

Note: the present sequence is not shown in the specification, but was

                                                              sequences that are differentially expressed during foam cell differentiation. The polynuclectide sequences of the invention or a composition comprising these polynuclectides are useful as a high throughput method for detecting altered expression of one or more polynuclectides in a sample. The polynuclectides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynuclectide sequences can also be used as PCR primars and probes. The polynuclectide sequences can also be used useful in gene therapy. Ass39401e Ass39621 represent the human polynuclectide sequences of the invention are also polynuclectide sequences of the invention which are differentially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              consists of contist water sequence. It currently is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

AMENGABEL TO AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cartivity, and can be used in gene therapy and vaccine production. (I) creatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased cample, they may be used to treat disorders associated with decreased cample, they may be used to treat disorders associated with decreased that affect the activity of (I) by expressing inactive proteins or to cyplement the patients own production of (I). Additionally, (I) projucteofides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the clargnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic artige genomic cancers and cancer metastases of haematopoietic artige genomic sequences from the present invention. AAK54912 to AAK54950 and AAM82169 very represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) activity, and can be used in gene therapy and vaccine production. (I) proteins and polyuncleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to pulpulement the patients own production of (I). Additionally, (I) polyuncleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, and cancer matationally cancer matationally dispasses, especially cancers and creat immune/haematopoietic-related dispasses, especially anc cancers and cancer metastases of hematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention. 1834 gattgtgccactgcactccagcctgggtgacagagcaagactctatctcaaaaaactaaa 1893 1894 taaataatgaaaaactcagtgcagatactgggcatctaggtttttct----tttctttc 1949 2010 gigatotoggotoactgcagcototogoctoctaggitoaagcgattotoctgcotoagco 2069 aaaaagaccgccagggctcaaacaaaaacctcggaaaagccctggcggtctttttt 120 tttttttttttttttttgggacagtcttgctctgtcgcccaggctggagtacaatggt 180 oggatettggctcactgcaacctctgcctccaggttcaagcaattcttctgcctcagcc 240 281 Score 204.2; DB 22; Length 56743; Pred.      32
activity, and can be used in gene therapy and vaccine production. (I)

proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased

expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
coplanciectides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynuclectides may be used to prevent.
If agnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic derived cells. AAK64703

to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK64921 to AAK64950 and AAM881169
                                                                                                                                                                   represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            179 gtcggatcttggctcactgcaacctctgcctcccaggttcaagcaattcttctgcctcag 238

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in per therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and expression by reactifying mutations or delections in a perient's generalized expression by rectifying mutations or delections in a perient's genome supplement the patients of (I) by expressing inactive proteins or to the nucleic decides may be used to product on of (I). Additionally, (I) the nucleic acids into a host cell and culturing the cell to express the

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or
New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID No 20764; 103pp; English.

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 20393; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-derived cells. AAK64703
concers and cancer metastases of haematopoietic artigen genomic
concers and acrose metastases of haematopoietic artigen genomic
sequences from the present invention. AAK54912 to AAK84950 and AAM82169
crepresent sequences used in the exemplification of the present invention.

Sequence 56632 BP; 17016 A; 8910 C; 10552 G; 20154 T; 0 other;

an analyte in a analyte-binding
                                                                                                                                                                                                    is.
                                                      The present invention relates to a method for assaying an analyte is sample comprising; contacting the sample with a mutant analyte-bind enzyme which has binding affinity for the analyte or an immediate analyte enzymeatic conversion product but has attenuated catalytic activity; and detecting resulting binding. The method is useful in monitoring biological systems/processes, or prognosis/diagnosis of disease caused by imbalances of the analytes. The present sequence a coding sequence used in the present invention.

Note: the present sequence is not shown in the specification, but we

```

The present invention provides a novel method of estimating the susceptibility of an individual to a developmental disorder using genetic and environmental variables. The method can be used in the diagnosis, prevention and treatment of disorders such as schizophrenia, spina bifida cystica, Tourette's syndrome, bipolar illness, autism, conduct disorders, attention deficit disorder, obsessive compulsive disorder, chronic
